

Calibration of the Simple Formula System

Place the disc towards the bottom of the Simple Formula System. Decide how much milk you wish to prepare at one time, e.g. 35 Fl Oz/1050ml. By using the scoop supplied with the milk powder dispense the required amount of level scoops into the system (in this example 35 scoops).

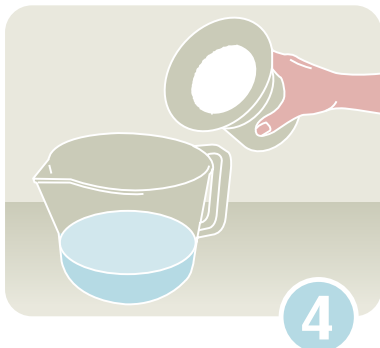

Gently shake the system from side to side to level the powder. Slowly push the disc upwards until the top of the powder reaches the *fill level* indicator on the side of the cylinder. For future reference, note and record the position of the disc by referring to the scale on the outside of the measuring system.

Fill a standard 1.5 or 2 litre measuring jug with the appropriate amount of cool, boiled water. In this example, the amount required is 35 Fl Oz/1050ml.

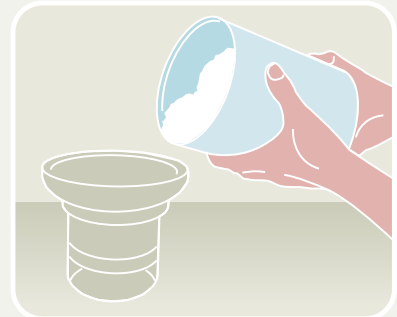

Prior to use, the system needs to be calibrated to your individual requirements according to the brand of milk powder and quantity of milk you wish to prepare.

Pour the powder from the Simple Formula System into the measuring jug and mix well with a spatula.

Pour the milk into individual bottles, e.g. five bottles with 7 Fl Oz/210ml.

Once calibrated

To prepare further feeds with the same quantity of milk:

- 1 Ensure that the disc is in the desired position by referring to the scale on the side of the measuring system.
- 2 Pour powder directly from the milk powder container into the Simple Formula System until the fill level is reached. Do not over or under fill the system or compact the powder.
- 3 Fill the measuring jug with the appropriate amount of cool, boiled water. Pour the powder from the measuring system into the measuring jug and mix well with a spatula. Pour the milk into individual bottles.

Always check that the disc is in the desired position prior to each use.

Notes and Guidance

Wash before initial use in a dishwasher (top rack only) or wash in warm water using mild liquid detergent. Rinse thoroughly with clean water. Avoid using harsh or abrasive cleaning materials.

Suitable for all forms of sterilisation. System must be completely dry before use.

The system will need to be calibrated again as the quantity or type of milk powder changes.

Always use the scoop supplied with the milk powder to calibrate the system.

If preparing enough milk for the whole day in advance, cool quickly under cold running water, store in the refrigerator (4 Deg C) and use within 24 hours. Always follow the guidance given by the milk powder manufacturer.

Note that the disc will be a loose fit prior to initial sterilisation.
